

LUKAS® ISV-Valve

Intelligent Selector Valve

The revolution in hydraulic valve technology

With the sensational new LUKAS development „Intelligent Selector Valve ISV“ the versatility and effectivity of motor pumps can be considerably increased. Each „ISV“ valve allows for an alternate operation of two rescue tools without any manual switchover. Depending on the power pack version the operation of three or even four rescue tools by just one motor pump is possible.

The valve can be coupled into the hose line or directly to the power package. Each rescue tool can be operated with its full capacity and with full working speed while it is protected against damage by overload or wrong operation through the sophisticated valve technology.

LUKAS power packs of earlier generations can also be equipped with the new valve: „ISV“ can be coupled to all existing LUKAS hoses by quick couplers.

ISV Valve completely equipped with quick couplers
